

About Noble Boats International Pty Ltd:

Noble Boats International boasts a wide range of quality aluminium boats to choose from. The range includes: centre console, side console, centre cabins, cuddy cabins and runabouts for lifestyle boating. All our plate aluminium boats are manufactured to the highest quality standards and can be used as specific fishing boats or for leisure boating. Our dealers are available in selected States and Territories in Australia.

Noble Boats International has been innovating, designing and producing world class plate aluminium boats. Noble Boats International has expert staff in all aspects of naval architecture, boat building, painting and electrical fit out to ensure your boat is finished to the exact standards you demand and should expect. We have successfully completed many projects ranging from the production of boats of 5 meters up to 12.5 meters.

Our designs have been forged from experienced naval architect plans using our many years of boating experience, research and innovation to make sure you are provided with a boat in which you, your family and friends will be safe and comfortable, in all conditions.

World Leaders in Quality

Noble Boats International are world class leaders in quality plate aluminum boat production. No where else will you find the intensity and diversity of quality control and production procedures which are standard at Noble Boats International. Every boat is built as though it were for ourselves, so we can guarantee your investment will remain in excellent condition through many years of enjoyment and use.

In addition to providing a great ride, we believe your boat must be capable of getting you home safely and comfortably in the toughest of conditions.

No other aluminium boat comes close to Noble Boats in design, materials and construction. Some of our outstanding quality features include:

- Noble Boats are superior structures, built at our factory to the Det Norske Veritas (DNV) standards.
- The material used is DNV marine grade alloy certified, with a 5 mm plate hull throughout (4mm on the bottom of 5.0 metre boats), and 4 mm plates on structural components.
- Our boats have fully welded sealed alloy decks, full seam welding inside and out, and have fully welded frames and girders, ensuring that structural members are not left floating and unfixed as in all other brands.
- All welders and fabricators at our factory are DNV and Bureau Veritas (BV) certified marine specialists.
- To ensure the utmost quality, full on site chemical, physical and weight testing is undertaken of all raw materials.

Every component of design and construction is managed to ensure the utmost quality is achieved in your boat.

- Quality management systems in place comply with international standards for quality assurance - ISO9001.
- All designs are prepared by naval architects on CAD software.
- All plate aluminium cutting is computerised allowing for the perfect fit.
- Every hull is personally inspected over and over and welds are x-rayed for defects, fuel and water tanks are baffled and pressure tested.
- Additionally, every boat is personally thoroughly inspected before it leaves the factory.

The style and strength of a Noble Boat is uncompromised. Design features and innovation in construction ensure a softer ride through all boating conditions. When at rest, these features also provide a stable platform for your recreational use. Rounded corners on all cabins and fixtures ensure enhanced style for your enjoyment, as well as greater safety.

Whether you choose our state-of-the-art Super Vee design or a conventional design, all our boats are rigorously tested to make sure they are the best in their field. Each Noble Boat is of superior integrity – in all aspects of design, construction, welding, fit out and finishing. No other boat can compare to the satisfaction that your Noble Boat will provide.

Design

Noble Boats International prides itself on building the highest quality plate aluminium boats on the market, and its ongoing research and development to keep at the forefront of the industry.

The Super Vee hull is a revolution in boat design – providing for the best quality boat and ride.

The bow incorporates a super fine forefoot which assures a soft dry entrance into head seas. Noble Boats have the deepest V shape hull on the market. It simply slices through the wave instead of bashing its way on top of the wave as in most other boats, ensuring a smooth ride for all passengers – even in the harshest conditions.

The midships contains a multichine hull, which allows for a very deep vee. This guarantees a soft ride, and also ensures a boat that is very stationary at rest, therefore providing a premium boating platform for all your activities whilst onboard.

A 24 degree deadrise allows water force to escape and not to be generated through the hull. This ensures maximum speed for minimal horsepower and fuel.

One of the main features of Noble Boats is that sets it apart from many of our competitors is the unique Super Vee Hull Design. In general terms a deep vee cuts the water and rides well but at rest is unstable under the foot. On the other extreme, a shallow vee or flat bottom boat is very stable but bangs underway giving a very rough wet ride.

The Super Vee Hull was developed to produce a hull that not only cuts through the water but gives superior stability on the run and at rest and minimize the amount of water thrown up by the hull.

To achieve this, the hull has a deep centre vee but incorporates several progressions in the dead rise of the hull. Deep along the centre, then reducing towards the pronounced reversed outer chine with a centre reversed chine. This uniqueness delivers an alloy boat with both a soft ride in the rough and stability at rest.

While the hull is certainly a very important part of the boat, a good fishing boat isn't complete unless significant thought has gone into the layout of the boat.

On a 5.0m centre console, a full walk around capability is provided allowing keen fisherman to hold their rods under the load of a big fish or running up to the bow of the boat to flick that lure out at a surf feeding school of mackerel.

There is plenty of storage and ample space to store most items when going out fishing. Side pockets are one of the most used storage areas on a boat and because the decks are fully sealed with buoyancy chambers, there is no need to use the space where side pockets are situated to locate buoyancy. Hence the generous area for side pocket use.

Decks are fully sealed so no water gets below deck level. Centrally located in the transom is the large scupper which can be left open or closed to let water in and out of the boat easily and unrestricted depending on the situation.

Unparalleled Safety

Noble Boats are built to withstand the harshest of environments. This does not mean they have to be taken out in the wildest conditions, but it does mean that you will get home safely if you are caught out in the roughest of seas. Construction using the latest technology also ensures that our plate aluminium boats are soft riding while moving, providing a fantastic ride, safe and controlled turning with excellent stability at rest, providing a safe platform for any activity on board.

Some of the safety measures of Noble Boats include:

- 5mm marine grade plate hull structure (4mm on the 5.0 metre boats).
- Full depth girders no more than 300mm apart, making them very strong in comparison to other methods of construction.
- The floor is self draining through transom scuppers, and completely sealed by being fully welded throughout. This makes the bottom cavity air tight, thus aiding flotation, and makes the deck waterproof.
- There are separate air tight chambers for fuel and storage.
- Stylishly rounded corners throughout the vessel to ensure safety to passengers.

These many safety measures ensure an unsurpassed level of safety, in a cutting edge boat.
