

Press Release

For immediate release: 27 June 2011

The new Basic Essential series of desalinators from Tecnicomar.

A new range of desalinators for those that are in the market for an entry level AC desalinator with minimal electronics.

Tecnicomar's new Basic Essential series offers four models producing either 80 or 160 litres per hour of high quality fresh water. The new Basic Essential models are available in a modular configuration for vessels that are lacking space or partially mounted in a compact frame offering an easier installation.

The new range still offers critical safety features such as low feed pressure protection and a high pressure safety cut out. These safety features are unheard of at this price point and protect the system from what could be expensive damage. Fresh water production is monitored by a flow meter on the control panel and an automatic fresh water flushing system with carbon block filter for removal of chlorine is available as an optional accessory.

"We found that there was a need for a budget priced desalinator in the Australian market" says Peter Byrne from WETSS. "Tecnicomar were quick to respond to our request and have exceeded our expectations with their new Basic Essential range". "Initial interest in the new models has been great and we will be displaying them at the upcoming Sydney Boatshow at the end of July".

Tecnicomar are Europe's oldest desalinator manufacturer and pricing for the new range starts at a retail price of AUD\$6,650.00 including GST.
